

codeExample()

The following function shows how to insert code examples along with their result in a document.

```
def codeExample(txt):
    beginTable("ll",width=getTextWidth()*0.9,
              model=stylesheet.DefaultTable)
    setFeeder('plain')
    pre(txt,CodeExampleStyle)
    endCell()
    setFeeder('xml')
    exec txt in globals()
    endTable()
```

Here are now some code examples, along with their result.

| | |
|--|----------------------------|
| <pre>p(""" A paragraph with some text """)</pre> | A paragraph with some text |
|--|----------------------------|

This is some text to explain the code example.

| | |
|--|--|
| <pre>p(""" A <u>paragraph</u> with some formatted text """)</pre> | A <u>paragraph</u> with some formatted text |
|--|--|

This is some text to explain the code example.

| | |
|---|------------------------------|
| <pre>pre(""" A preformatted paragraph. """)</pre> | A preformatted paragraph. |
|---|------------------------------|

This is some text to explain the code example.
