

## codeExample()

The following function shows how to insert code examples along with their result in a document.

```
def codeExample(txt):
    beginTable("ll",width=getTextWidth()*0.9,
              model=stylesheet.DefaultTable)
    setFeeder('plain')
    pre(txt,CodeExampleStyle)
    endCell()
    setFeeder('xml')
    exec txt in globals()
    endTable()
```

Here are now some code examples, along with their result.

<pre>p( """ A paragraph with some text """ )</pre>	A paragraph with some text
--	----------------------------

This is some text to explain the code example.

<pre>p( """ A &lt;u&gt;paragraph&lt;/u&gt; with some &lt;b&gt;formatted&lt;/b&gt; text """ )</pre>	A <u>paragraph</u> with some <b>formatted</b> text
--	--

This is some text to explain the code example.

<pre>pre( """ A preformatted paragraph. """ )</pre>	A preformatted paragraph.
---	------------------------------

This is some text to explain the code example.
