

## memo()

foo

The function `memo()` is designed for quick typing of more than one paragraph.

- first list item
- second list item

You can now also use the `typewriter` tag.

And if there is a blank line in a memo, this leads to a new paragraph.

You can even define simple tables:

A	
B	
C	
1	
2	
3	

[illegible]
